

Identifying Quadrilaterals

Name: _____

Date: _____

A **quadrilateral** is a closed 2D shape with 4 straight sides and 4 corners. Some quadrilaterals have special names. The following shapes are all quadrilaterals.

		
<p>A parallelogram has two pairs of parallel sides which are the same length.</p>	<p>A rectangle is a parallelogram which has four right angles (square corners)</p>	<p>A square is a special kind of rectangle where all of the sides are the same length.</p>
		
<p>A rhombus is a parallelogram where all of the sides are the same length. Squares are also rhombuses.</p>	<p>A trapezium looks like a triangle with a corner cut off. It has two parallel sides.</p>	<p>A kite has two pairs of sides which are the same length. The sides in each pair are next to each other rather than parallel.</p>

Rectangles, squares and rhombuses are all parallelograms.

A square is a special type of rectangle in which all the sides are the same length. It is also a rhombus in which all angles are right angles.

A rhombus is a special type of kite in which all the sides are the same length.

- Choose two of the quadrilaterals above and draw them using the dots below.
